Project Implementation Plan: Story to Task mapping

User Story1:

As a receptionist, I want to check in/check out patients and update visit status so I can ensure accurate visit tracking.

Tasks

1) Create PatientVisit class to manage visit status
2) Add status field in database (Booked, Checked-In, Checked-Out, No Show, Cancelled).
3) Develop receptionist dashboard UI to update status.
4) Write backend logic to update visit status in database
5) Display confirmation message after status change.
6) Test status updates with different visit scenarios.

User Story2:

As a patient, I want to create an account online so that I can book, view, cancel, or reschedule appointments.

Tasks

1) Design patient registration web page.
2) Create PatientAccount database table.
3) Implement form validation (email, password, required fields).
4) Develop backend API to save new accounts.
5) Implement email confirmation service.
6) Encrypt passwords before storing.
7) Test account creation and login functionality.

User Story3:

As a patient, I want to book appointments online.

Tasks

1) Create Appointment database table.
2) Develop calendar interface to display available time slots.
3) Write logic to prevent double booking.
4) Connect appointment form with backend.
5) Send confirmation email after booking.
6) Fix booking conflicts if detected.

User Story4:

As a patient, I want to reschedule or cancel my appointment online.

Task

1) Create appointment management page.
2) Update appointment status in database.
3) Release cancelled time slot back to system.
4) Send updated confirmation notification
5) Test cancellation and rescheduling scenarios.

User Story 5:

As a nurse, I want to record patient vitals and notes before the doctor visit.

Tasks

1) Add Vitals table (temperature, weight, height, blood pressure).
2) Create nurse input form UI
3) Connect form to patient visit record
4) Enable editing of vitals before doctor consultation
5) Restrict access to nurse &/or specific doctors role only.
6) Test saving and retrieving vitals data.

User Story6:

As a doctor, I want to record diagnosis and prescribe medication.

Tasks

1) Create MedicalRecord table in database
2) Develop doctor dashboard interface.
3) Add fields for symptoms, diagnosis, medications.
4) Implement prescription print feature (PDF)
5) Create electronic prescription API (if pharmacy supports).
6) Secure records with role-based authentication.
7) Test record saving and retrieval

User Story7:

As a receptionist, I want to verify patient health cards in real time with the Ministry system.

Tasks

1) Research Ministry health card API requirements.
2) Develop API integration module
3) Create verification form in receptionist dashboard.
4) Display eligibility response (Valid/Invalid/Expired)
5) Store verification result in patient file
6) Handle system timeout or API failure errors.

User Story8:

As a system, I want to manage walk-in queue and urgent triage cases.

Tasks

1) Create QueueManagement class.
2) Add priority level field (Normal/Urgent/Critical).
3) Develop real-time queue display screen.
4) Implement logic for priority override

5) Connect queue with doctor availability.

User Story 9:

As a billing system, I want to process non-covered services and manage payments.

Tasks

1) Create Billing and Payment tables.
2) Add service pricing configuration.
3) Integrate credit card payment gateway.
4) Enable cash payment recording option.
5) Generate payment receipt (print/PDF).
6) Update accounts receivable records.

User Story10:

As a manager, I want reports on visits, financials, and clinic usage.

Tasks

1) Identify required KPIs (visits per day, revenue, no-shows).
2) Create reporting database queries.
3) Develop manager dashboard interface
4) Generate downloadable PDF reports or database in form of CSV.
5) Implement role-based access for manager only.
6) Test report accuracy with sample data.
